Eberline is good to go. I spoke with them and they are confident they can handle the sample load. They also said they will provide results as they become available. So, alpha/beta and cesium will be 24 to 72 hours, uranium is 72 hours if all goes well. Plutonium and Americium should be at 5 days and possibly sooner. The 5 day TAT prices will be honored for the alpha spec isotopes even if they report in 3 days.

Their biggest concern is strontium. If we have them report total strontium, quick TAT is "easy". If we have them report 90, then the sample has to sit for a minimum of 10 days for Yttrium-90 ingrowth. Maybe we do the first couple of days with st-90. If we see there is no st-89, then we move to total. ???
